

① RECORD CORRECTION — TAO Halving Date

A prior archive PDF contained a factual error. It stated the second halving would occur *in late 2026 or 2027* — off by 2-3 years. Source confirmed via Taostats.io (official block explorer).

Halvening	Date	Block Reward	TAO Supply
H1 — First	Dec 15, 2025	0.5 TAO	10,500,000
H2 — Second ♦	Dec 12, 2029	0.25 TAO	15,750,000
H3	Dec 10, 2033	0.125 TAO	18,375,000
H4	Dec 7, 2037	0.0625 TAO	19,687,500

Halvings are supply-based (every 10.5M TAO issued) — approximately every 4 years. **This record supersedes all prior references.**
Next halving: **December 12, 2029.**

② MANTIS (SN123) — Decentralized Signal Refinery

Source: TAO Daily — How MANTIS Orchestrates a Coordinated Pipeline for Intelligent Trade Execution. **Relevance to TaoBot:** HIGH.

- SN123 is a decentralized forecasting subnet — miners submit prediction embeddings; validators score by **marginal information gain**. No marginal gain = no reward. It prices signal quality, not opinion.
- 4-layer pipeline: Upstream subnets (SN13, 33, 6, 22, 50, 82) → MANTIS filters signal → Meta-models (direction, regime, volatility) → **Vanta (SN8)** executes under risk constraints.
- Architecture is *cyclical*: some subnets feed upstream priors into MANTIS and later consume MANTIS outputs downstream — reinforcing feedback, not a linear pipe.
- **Vanta (SN8)** is the execution endpoint — already doing risk-gated trade selection. Future TaoBot integration candidate.
 - *TaoBot's internal signal layer should weight strategies by marginal gain, not equally. A signal that doesn't improve the ensemble prediction gets deprioritized — no manual tuning required.*

③ TEUTONIC (SN3) — Bittensor's Answer to Covenant

Source: TAO Daily — Teutonic (SN3) Is Cooking a 24B Looped Transformer. **Relevance to TaoBot:** MEDIUM-HIGH.

- Const rebuilt SN3 from scratch **4 days after Covenant AI abandoned Templar**. Renamed Teutonic. Seed king: 0.9B Gemma3, launched April 13, 2026. Loss: ~13 → low 5s through open competition.
- **24B Looped Transformer:** Reuses the same weight block multiple times per forward pass. Reasoning depth becomes an inference-time knob — more loops = deeper reasoning without more training parameters.
- ByteDance's Ouro: 1.4B looped model performing like 12B on benchmarks. Claude Mythos suspected to use same architecture (~80% on GraphWalks BFS vs GPT-5's 21%).
- King-of-hill mechanism: hardware-agnostic — only cross-entropy loss matters. Opens the field to data curation, training tricks, and architectural innovation.

■ **DO NOT BUY SN3 alpha token — owner key situation unresolved. Const's own warning. TaoBot watchlist: SN3 stays YELLOW.**

■ *Looped architectures = inference-time compute scaling. When TaoBot adds AI-based signal generation, prefer models that reason deeper over models that are merely larger.*

④ THE ORCHESTRATOR PDF — Key Takeaways

Source: The Orchestrator.pdf — Authored by II Agent, April 15, 2026. 14 pages. Already in The Archives.

- **Architect vs Orchestrator:** The Architect designs once (12 strategies, OpenClaw, gate pipeline). The Orchestrator runs continuously — reads market, scores fleet, classifies regime, generates directives. Two distinct roles. Never confuse them.
- Everything described in the document is already live: II Agent 5-min cycle, BULL/BEAR/SIDEWAYS/VOLATILE regime detection, HOT/HEALTHY/WATCHING/STRUGGLING fleet tiers, 40-entry observation ring buffer, directive generator, OpenClaw BFT at 33.9% approval.
- **Section VIII — What's NOT yet built** (the real roadmap): Regime-aware position sizing · Consecutive loss circuit breaker · Performance trending detection · Cross-strategy correlation detection · OpenClaw-weighted regime · Validator performance weighting by subnet.
 - *Circuit breaker first: WR averages hide streaks. A 60% strategy can go 0-for-8 on a bad night. The consecutive loss circuit breaker catches what averages miss.*
 - *Cross-strategy correlation detection is subtle but critical — 10 bots agreeing BUY off the same MACD signal is one signal counted 10 times, not true consensus.*

⑤ WHAT'S NOT YET BUILT — Section VIII Is the Roadmap

Page 13 of The Orchestrator PDF lays out six future enhancements. **None of these are cosmetic.** Each one closes a gap between *autonomous system running* and *autonomous system running optimally*.

Enhancement	What It Does	Priority
Regime-Aware Position Sizing	Auto-reduce trade_amount in VOLATILE. Full size in BULL. In BEAR, bias toward minimum. System adapts to market conditions.	HIGH
Consecutive Loss Circuit Breaker	N losses in a row → pause strategy immediately, regardless of overall win rate average. Catches streaks that averages hide.	HIGH
Performance Trending Detection	WR trending down over 20-trade window fires early warning before the demotion threshold is breached. Catches decline early.	MEDIUM
OpenClaw-Weighted Regime Classification	If BUY votes declining week-over-week, weight regime toward BEAR. Fleet's own signal quality feeds back into regime detection.	MEDIUM
Cross-Strategy Correlation Detection	8+ bots generating the same signal → flag as correlated input, not true consensus. Prevents false confidence in BFT votes.	HIGH
Validator Performance Weighting by Subnet	Track TaoBot's validator returns per subnet. Route toward subnets where it genuinely outperforms — not just preference.	MEDIUM

■ *Build order recommendation: Circuit Breaker first (protects capital now), then Correlation Detection (fixes a known BFT blind spot), then Regime-Aware Sizing (the highest leverage improvement long-term).*

⑥ HOSTING DECISION — PENDING

Platform	Always-On	RAM	No Card	Verdict
Render Free	✗ Sleeps	512MB	✓	Wrong for bot
Fly.io Free	✓	256MB	✗ Card	RAM too low

Oracle Always	✓	1GB	✗ Verify	Best free option
Vultr (\$6/mo)	✓	1GB+	✓ Crypto	Best paid option
Railway Hobby	✓	512MB	✗ Card	Easiest upgrade

Decision: Wife's credit card available. Railway Hobby (\$5/mo) is the fastest path. Vultr (\$6/mo, Bitcoin accepted) is the decentralized path. Migration guide is written — 1–2 hours to execute. **Do this at the start of the next coding session.**

“Architecture tells you how the pieces fit. Orchestration tells you how the pieces move. The Orchestrator is already moving. Every path leads to TaoBot.”
